

# HomeMEETING

HomeMeeting is a reliable system for online meeting and instant messaging, a solution that is intuitive for users and cost-effective for the business.

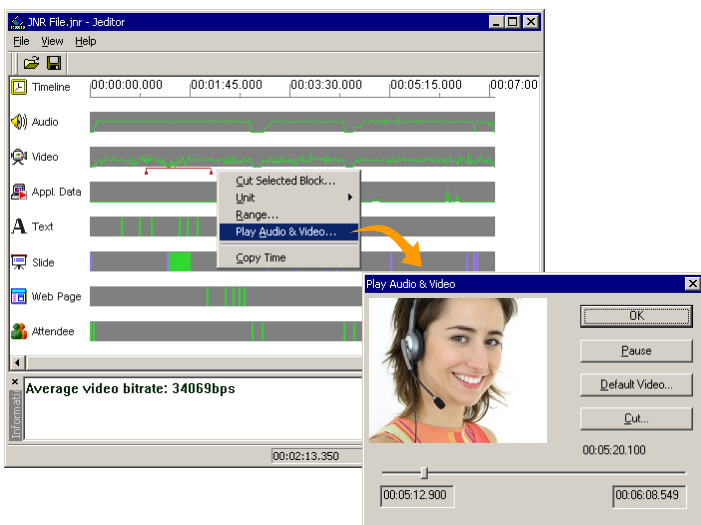

The recording feature of the **HomeMeeting server** allows users to record a complete online meeting, including audio, video, slide presentation and annotation, synchronized web browsing, desktop and application sharing, and remote-control processes.

Recording files can be shared through emails and/or posted to web pages for convenient user access, while owners of recording files can also ensure the security of the shared recordings by permitting name-user playback via **HomeMeeting Messenger**.

Recording files can be replayed using **JoinNet** and can be edited by using **HomeMeeting Jeditor**.

HomeMeeting server keeps the playback history of a shared recording file, allowing the owner to view who played back the file, at what time and for how long. Owners of shared recording files can unshared their recordings, anytime, anywhere.

Online Studio

The online recording feature of HomeMeeting can help users to facilitate an online studio to create and to share multimedia contents collaboratively—regardless time or location—when they need:

- a better way to deliver product knowledge, for example, channel training and communications on concepts, product information, and selling skills;
- a better way to provide technical support, for example, troubleshooting Q&A, software demo, and real-life technical guide;
- a better way to present training materials through online interviews, panel discussions, and case studies;
- a better way to submit team reports and meeting minutes;
- a better way to share comprehensive information, involving big attachments, web pages, and desktop sharing;
- a better way to archive knowledge and experiences.
